Exercises to the lecture

**Exercise 2.1** (The language  $COPY^k$  in space and time)

Let  $\Sigma = \{a, b, \#\}$  be an alphabet. We define the language  $COPY^k$  as follows:

$$COPY^{k} = \{w.\#.w.\#...\#.w.\#.w \mid w \in \{a, b\}^{*}, \# \text{ occurs } k \text{ times}\}$$

Note that the language COPY from the last exercise sheet is just  $COPY^1$ .

Show the following:

- a)  $COPY^k \in \mathsf{DTIMESPACE}(\mathcal{O}(n), \mathcal{O}(n)).$
- b)  $COPY \in \mathsf{DSPACE}(\mathcal{O}(\log n)).$

Recall the definition of DTIMESPACE and note that there is an additional input tape.

**Exercise 2.2** (Complement classes)

Let  $C \subseteq \mathbb{P}(\{0,1\}^*)$  be a complexity class. The complement class of C is defined as:

co- $C = \{L \subseteq \{0, 1\}^* \mid \overline{L} \in C\}.$ 

- a) Prove that if C is deterministic, we have: C = co-C.
- b) Let I be an index set and  $C_i, i \in I$  complexity classes. Show that the following equality holds:

$$\operatorname{co-}\bigcup_{i\in I}C_i=\bigcup_{i\in I}\operatorname{co-}C_i.$$

c) Deduce from the previous results that P = co-P.

**Exercise 2.3** (Tape compression)

Show that for all  $0 < \varepsilon \leq 1$  and all  $s : \mathbb{N} \to \mathbb{N}$ , we have:

$$\mathsf{DSPACE}(s(n)) \subseteq \mathsf{DSPACE}([\varepsilon \cdot s(n)]).$$

Hint: Choose c to be  $\lfloor \frac{1}{\varepsilon} \rfloor$ . Then simulate a 1-tape Turing Machine M by a 1-tape Turing Machine M' with tape alphabet  $\Gamma^c$ . Encode a block of c cells of M into one cell of M'. Note that you have to remember the position of M's head inside such a block. How much space does M' use ?
